

The Status and Evolution of the BWA Marketplace

# **Worldwide Frequency Outline**

| World-Wide Regulatory Bands - > 20 GHz, Point to Multipoint |                 |                                |                      |  |
|---|-----------------|--------------------------------|----------------------|--|
| Country   | Frequency       | Bandwidth                      | No. of Operators     |  |
| USA   | 24 GHz          | 200 MHz to 40 MHz, one-way     | 1 operator           |  |
|   | LMDS Block A    | 28, 29, 31 GHz, 1150 MHz total | 1 operator           |  |
|   | LMDS Block B    | 31 GHz, 150 MHz total          | 1 operator           |  |
|   | 38 GHz          | N X 50Mhz paired blocks        | 2, 3 operators       |  |
|   | 40 GHz          | Future                         | 1 assumed            |  |
|   | 60 GHz          | Future                         | 1 assumed            |  |
|   |                 |                                |                      |  |
| Canada  | LMCS            | 25-28 GHz, 1 GHz chunks        | 3 operators          |  |
|   | 38 GHz          | Future                         | 2 operators assumed  |  |
|   |                 |                                |                      |  |
| Japan   | 23 GHz - 28 GHz | Variety of bandwidths          | 2 operators expected |  |
|   |                 |                                |                      |  |
| Europe  | 26 GHz          | Various between countries      | 1                    |  |
|   | 40 GHz          | 3 GHz of bandwidth             | 2 operators expected |  |
|   | 28 GHz          | LMDS Equivalent                | 1                    |  |
|   |                 |                                |                      |  |
| Korea   | 22, 23, 24, 26  | ?                              | ?                    |  |
|   |                 |                                |                      |  |
| A -:-   | 00 1- 00 011-   | Maria harad ralaraa            |                      |  |

# **USA Bandwidth per Frequency Block**

The spectrum available to the operator will limit the service offering which they provide. That limitation is not the same.

| USA Bandwidth per Frequency Block   |                                |                |  |  |  |
|-------------------------------------|--------------------------------|----------------|--|--|--|
| Assume 4QAM Modulation @ 1.5 b/s/Hz |                                |                |  |  |  |
| 24 GHz                              | 200 MHz to 40 MHz, one-way     | 300 to 60 Mbps |  |  |  |
| LMDS Block A                        | 28, 29, 31 GHz, 1150 MHz total | 862 Mbps       |  |  |  |
| LMDS Block B                        | 31 GHz, 150 MHz total          | 115 Mbps       |  |  |  |
| 38 GHz                              | N X 50 MHz paired blocks       | N X 75 Mbps    |  |  |  |
| 40 GHz                              | Future                         | ?              |  |  |  |
| 60 GHz                              | Future                         | ?              |  |  |  |

#### **Service Possibilities**

Possible services offered using Point-to-Multipoint BWA networks include:

TDM Legacy Services (DS0, DS1, structured DS1)

- Typically symmetrical services

**IP Application Based Offerings** 

- In this case, it may make sense to offer raw IP over the air for termination into IP infrastructure.
- IP application offering may be highly asymmetrical, with different bandwidth requirements in both directions.

**ATM Application Based Offerings** 

Video Broadcast / Multicast Offerings

High Availability Systems with wireless used as backup for existing wireline

### **Low Frequency Systems**

MMDS (2.5-2.7 GHz) systems

Recent FCC ruling allows two-way applications within MMDS bands

Low frequency systems below 10 GHz are much different than high frequency systems >20 GHz.

Multipathing

Foliage Penetration

**Equipment Cost Curves** 

Antenna Size

Rain and Weather Effects

**In-Building Penetration** 

Microwave Power available

Note that PCS frequencies are at 2 GHz, and so mobility now becomes a possibility for this frequency band.

### Other Wireless Standards and Activity

Narrowband - 64 Kbps voice

Wideband < 2 Mbps, third-generation

Broadband > 2 Mbps

#### Third-Generation

2 standards are developing, one from Qualcomm and the other from the rest of the industry

GSM, Digital Cellular, PCS would like to have fixed terminals as well for the low bandwidth user. Standards like CDPD and others will evolve for these applications.

Therefore, when we look at the N-WEST standards activity around BWA, do we target wideband and broadband, and therefore compete with 3-G standards evolution?

# **Application Domain**

Wireless is typically used for mobility. Typically call handoff (session handoff) is a requirement.

BWA systems at the frequencies above 20 GHz are for fixed users, and typically are building to building using Line of Sight links. Hand-off is not required.

The BWA systems at low frequencies below 10 GHz are for fixed users also, but may evolve into mobility.

Portable users (who move around during non-transmission but are fixed during transmission) may be possible at high frequencies.

Nomadic users (who move within a cell coverage area during transmission so that hand-off is not required) need multipath design but not hand-off.

#### Conclusions

Standards activity with respect to Broadband Wireless Access (BWA) systems must recognize that different system operators will have different service plans, simply due to competitive pressures within the marketplace.

Customers will be biased towards IP, ATM or other methods.

The standard will probably compete poorly with the future 3G standard, and therefore should be designed for the support of the upper range of narrowband operation.
